

The Casing Alignment Pin (CAP) is designed to reduce assembly time while increasing safety when dealing with misaligned casing bolt holes.

Conventional bolt alignment methods consists of bolt torque sequencing or hammering studs which is time consuming and could possibly lead to damaged components.

The CAP solves this problem by using a two piece alignment system consisting of a collet and tapered pin. Giving you the ease of a drop-in installation but also providing you with the angular force necessary to correct the misalignment. Offering an easy, quick, and durable solution to your problems.

In the event you need a product for a specific application or have a space requirement, Riverhawk can custom design your solution.

THE CASING ALIGNMENT PIN

Features and Benefits

- Aligns and closes gaps on casing bolt holes
- Simple installation and removal
- Loose collet fit for ease of installation
- Reduce assembly time and component damage
- No modifications needed to install or remove
- Custom designed for your needs
